## Purpose

Book & Notes Vault is a web application that allows users to store and manage information about books. Accessibility is important because all users should be able to use the application regardless of how they interact with the books-and-vault web app.

This plan outlines the accessibility features that will be included during development.

## Semantic HTML Structure

To make the website easy to use for all types of users.

The main page structure will include:

- `<header>` for the site title and navigation
- `<nav>` for navigation links
- `<main>` for the main content
- `<section>` for different parts of the application
- `<footer>` for project information

A clear heading hierarchy will also be used to help screen readers understand the page structure.

- H1 – Book & Notes Vault
- H2 – About, Dashboard, Records, Add/Edit Book, Settings
- H3 – Dashboard cards and smaller section headings

## Keyboard Navigation

Users should be able to:

- Navigate through links and buttons using the Tab key
- Move backwards using Shift + Tab
- Submit forms using Enter

## Forms and Validation

Validation error messages will appear when validation fails.

Examples:

- Title cannot be empty
- Pages must be a number greater than zero.
- Tag starts with hash (#)

Error messages will be displayed close to the relevant field so users can easily identify the problem.

Placeholders will only be used as hints and not as replacements for labels.

## **ARIA Live Regions**

ARIA live regions will be used to announce important updates without requiring the user to refresh the page.

Examples:

- Book successfully added
- Book updated
- Book deleted
- Import successful
- Import failed
- Reading goal exceeded

## **Dark/Light Theme**

The book-and-vault web application will have both light and dark theme to cater for the user's lighting environment. Dark themes are very handy in the night to reduce the amount of light bouncing into a user's eyes.

## **Responsive Design**

The website will be designed using a mobile-first approach with breakpoints for:

- Mobile: 360px and above
- Table: 768px and above
- Desktop; 1024px and above

The web application will be responsive-aware and display content based on the user's device.
